SKILLS

Languages: Python, TypeScript/JavaScript, SQL, C#, Java

Backend: Node.js, FastAPI, Django, ASP.NET, REST APIs

Frontend: Vue.js, React, Next.js, HTML, CSS

Databases: PostgreSQL, Oracle, MySQL

Integration: EDI (X12), AS2, SFTP, CData Arc, TCP socket

Cloud & Tools: Linux, Windows Server, AWS, PAD, Google Cloud Platform (Cloud Run), Docker, Git

EXPERIENCE

ComGen America, Software Engineer, Auburn, AL

February 2023 – Present

Logistics, scanning, and EDI/EAI systems for automotive OEM and supplier plants (Hyundai/Kia/Ford/GM)

- Designed, developed, tested, deployed, and supported full-stack logistics and production applications using Python, TypeScript, C#, Vue, Node.js, Django, and relational databases across Windows Server and cloud environments.
- Built and maintained REST APIs and application integrations supporting inventory, production planning, part validation, ASN generation, shipping, and real-time shop-floor workflows across five partner environments.
- Modernized legacy C#/ASP.NET and Java-based applications with TypeScript, Vue, Node.js, and Django; coordinated requirements, code reviews, UAT, staged releases, and production troubleshooting with internal teams and customer stakeholders.
- Redesigned EDI ingestion using temporary tables, indexing, validation, and transactional batch inserts, reducing processing time from 23 seconds to about 5 seconds for a pipeline handling roughly 1,000 daily transactions.
- Built workflow automation for internal business processes, including Power Automate-based automation and a web application that categorized corporate card transactions and generated reconciliation reports, reducing a monthly manual Excel process from about one hour to 10 seconds.
- Migrated partner integrations from on-premises servers to AWS using EC2, VPC, S3, IAM, CloudWatch, and Site-to-Site VPN, while deploying and troubleshooting applications across Windows Server and Linux-based cloud environments.
- Improved deployment and production reliability through structured logging, health checks, Git-based development workflows, and CI validation, enabling faster identification of application, network, and partner-side failures.

PROJECTS

Picking Up | Full-Stack Task and Routine Planner | [Link](#)

- Built and operated a production planner across Vercel and Google Cloud Run; API latency by over 90% (30+ seconds to under 3 seconds) by migrating its database from Oracle Autonomous Database to Neon PostgreSQL.
- Designed transactional APIs for task nesting, rescheduling, and reordering, using row-level locks and optimistic concurrency control (If-Match versioning) to reject stale writes with 409 Conflict responses and keep multi-row updates atomic.
- Enforced case-insensitive uniqueness and hierarchy/scheduling CHECK constraints through staged migrations that backfilled existing data; verified behavior with 190+ backend tests and a GitHub Actions check that rejects uncommitted Django migrations.

Personal Finance Copilot | [Link](#)

- Built a FastAPI/PostgreSQL service to ingest and categorize bank and credit-card transactions across three institutions and four CSV formats, with idempotent imports, schema validation, and deterministic financial calculations separated from LLM outputs.
- Built a labeled evaluation dataset across 33 transaction categories and benchmarked Claude Haiku 4.5 against keyword-based rules, achieving 0.73 weighted F1 at approximately \$0.0019 per transaction.
- Developed an offline LLM evaluation pipeline using development and merchant-separated holdout sets to detect category bias and prompt overfitting before adopting model changes.

EDUCATION

Georgia Institute of Technology, Atlanta, GA

January 2024 – December 2027

Master of Science in Computer Science (OMSCS)

Stony Brook University, Stony Brook, NY

January 2019 – December 2022

Bachelor of Science in Applied Mathematics and Statistics
