

SOFTWARE ENGINEER

Jay (Jaehoon) Jung

Backend-focused engineer building reliable systems, APIs, and complete web products.

Python / TypeScript / SQL / Django / FastAPI / PostgreSQL
/ AWS

Picking Up

A task and routine planner designed for recurring work, automated unfinished-task rollover, and complex task nesting.

ROLE & STACK

Led product design, Django backend architecture, data modeling, and authentication. Managed deployment and reviewed Next.js frontend implementation.

Next.js • Django REST • Neon PostgreSQL • Google Cloud Run

ENGINEERING DECISIONS

- Versioned transactional command endpoints for consistency
- Atomic transactions with row-level locks for safety
- 409 Conflict handling for stale write prevention
- Optimistic reconciliation engine for fluid UX

[Live App](#) [GitHub](#) [Case Study](#)

Browser → Next.js BFF → Django REST API → Neon PostgreSQL

02 // SELECTED WORK

Personal Finance Copilot

Python-based backend processing inconsistent bank CSVs into validated transactions for deterministic financial comparison.

ARCHITECTURE FLOW

Engineered a pipeline for CSV ingestion, exact calculation rule enforcement, and LLM-assisted categorization evaluation.

Python 3.12 • FastAPI • SQLAlchemy 2 • Anthropic API • Render

742

TRANSACTIONS IMPORTED

1,186

PASSING TESTS

Evidence: 135-row merchant-disjoint validation benchmark ensures deterministic accuracy across fragmented data sources.

[Live Demo](#)

[GitHub](#)

[Case Study](#)

CSV Import → Validated Transactions → Rules/LLM → Decision Engine

03 // SELECTED WORK

Interested in building reliable systems together?

I am currently focused on backend systems, robust APIs, and data-intensive products that solve real problems.
