SKILLS

Languages: TypeScript/JavaScript, Python, SQL, C#

Backend: Node.js, FastAPI, Django, ASP.NET

Frontend: Vue.js, React, Next.js

Databases: PostgreSQL, Oracle, MySQL

Integration: EDI (X12), AS2, SFTP, CData Arc, TCP socket

Cloud & Tools: AWS, Google Cloud Platform (Cloud Run), Docker, Git

EXPERIENCES

ComGen America, Software Engineer, Auburn, AL

February 2023 – Present

Logistics, scanning, and EDI/EAI systems for automotive OEM and supplier plants (Hyundai/Kia/Ford/GM)

- Built production applications end to end — system design, API development, deployment, monitoring, and incident response — delivering WMS, EDI, and JIS workflows (inventory, production planning, part validation, ASN generation, shipping) with client stakeholders across five partner environments.
- Redesigned EDI ingestion from per-document sequential processing to staged bulk loading (temp tables, indexing, validation, transactional batch inserts), cutting processing time from 23s to ~5s for a ~1,000 transaction/day pipeline across five B2B partners.
- Migrated socket-based partner integrations from on-premises servers to AWS (EC2, VPC, S3, IAM, CloudWatch, Site-to-Site VPN), reducing connectivity-related downtime from ~3 incidents/month to ~1/year and cutting infrastructure maintenance cost to 30% of the on-prem baseline.
- Cut recurring support calls by making failures self-diagnosable for end users: standardized error codes, restructured application logs, and exposed real-time health checks and CloudWatch dashboards — letting operators distinguish partner-side and network faults from application faults without escalation, and providing evidence for fault isolation during partner incidents.
- Modernized legacy C#/ASP.NET applications into TypeScript/Vue interfaces backed by Node.js or Django services; established shared application patterns, reviewed pull requests from junior engineers, and ran a staged test-server → production release process with stakeholder UAT before each deployment.
- Built an internal web application automating corporate credit card statement processing — transaction grouping, categorization, and report generation — replacing a manual Excel workflow and reducing monthly reconciliation from ~1 hour to ~10 seconds.

PROJECTS

Picking Up | Full-Stack Task and Routine Planner | [Link](#)

- Built and deployed a full-stack planning application using Next.js, TypeScript, Django, and PostgreSQL, with optimistic UI updates and cloud deployment across Vercel, Google Cloud Run, and Neon.
- Designed atomic task operations using database transactions, row-level locking, and version-based conflict detection to prevent stale or concurrent updates; secured authentication through a Next.js BFF with HTTP-only JWT cookies and rate limiting.

Personal Finance Copilot | [Link](#)

- Built a FastAPI/PostgreSQL service to ingest and categorize bank and credit-card transactions from three institutions across four CSV formats, with idempotent imports, validation, and deterministic exact-decimal calculations isolated from the LLM.
- Hand-labeled 400 transactions across 33 categories and created a merchant-separated validation set; Claude Haiku 4.5 achieved 0.73 weighted F1 at \$0.0019 per row and correctly classified 82 transactions missed by keyword rules, while rules recovered only one model miss.
- Rejected a prompt revision whose metric gain came from predicting fewer categories rather than better ones, then tuned the adopted revision on development data alone and measured how much of that gain survived on the untouched benchmark.

EDUCATION

Georgia Institute of Technology, Atlanta, GA

January 2024 – December 2027

Master of Science in Computer Science (OMSCS)

Specialized in Computing Systems

Stony Brook University, Stony Brook, NY

January 2019 – December 2022

Bachelor of Science in Applied Mathematics and Statistics
