SKILLS

Languages: Python, TypeScript/JavaScript, SQL, C#, Java

Backend: Node.js, Django, FastAPI, ASP.NET, REST APIs, Spring Boot

Frontend: Vue.js, React, Next.js

Databases: PostgreSQL, Oracle, MySQL

Cloud & DevOps: AWS, Google Cloud Platform, Docker, CI/CD, Linux, Git

EXPERIENCE

ComGen America, Software Engineer, Auburn, AL

February 2023 – Present

Logistics, scanning, and EDI/EAI systems for automotive OEM and supplier plants (Hyundai/Kia/Ford/GM)

- Redesigned a Python ETL pipeline for X12 EDI order and shipping data from five automotive partners over AS2/SFTP, cutting processing latency from ~20s to ~5s through Oracle indexing, staging tables, query optimization, and transactional batch inserts.
- Built and supported Python and C#/.NET applications across five automotive partner environments, along with Vue.js web systems backed by Spring Boot or Node.js for inventory, production planning, ASN, and shipping workflows.
- Migrated a three-server production environment from on-premises to AWS (EC2, VPC, Site-to-Site VPN), reducing estimated infrastructure costs by ~40% and eliminating recurring connection-failure downtime through improved exception handling and automated recovery.
- Strengthened backend logging and introduced automated email alerts for system errors, outages, and recovery events, helping on-call engineers and maintainers detect incidents sooner and diagnose root causes faster.
- Modernized legacy C#/ASP.NET and Java applications with TypeScript, Node.js, and Django while preserving business rules and integration behavior; added CI build validation and coordinated code reviews, UAT, and staged releases.
- Built an internal AI coding agent grounded in legacy code, repository structure, and team conventions, adopted by four engineers across three projects to generate code consistent with existing architecture and development patterns.
- Built reconciliation and task-assignment workflows for a company-wide operations application, reducing monthly corporate-card reconciliation from ~1 hour of manual Excel work to ~30 seconds.

PROJECTS

Picking Up | Full-Stack Task and Routine Planner | [Link](#)

- Built and deployed a production task planner on Vercel and Google Cloud Run; reduced API latency by >90% (30s+ to <3s) by migrating from Oracle Autonomous Database to Neon PostgreSQL.
- Designed transactional APIs for task nesting, rescheduling, and reordering, using row-level locks and optimistic concurrency control to reject stale writes with 409 Conflict responses and keep multi-row updates atomic.
- Enforced case-insensitive uniqueness and hierarchy/scheduling CHECK constraints through staged migrations that backfilled existing data; verified behavior with 190+ backend tests and a GitHub Actions check that rejects uncommitted Django migrations.

Personal Finance Copilot | [Link](#)

- Built a FastAPI/PostgreSQL service to ingest and categorize bank and credit-card transactions across three institutions and four CSV formats, with idempotent imports, schema validation, and deterministic financial calculations separated from LLM outputs.
- Developed an offline LLM evaluation pipeline using development and merchant-separated holdout sets to detect category bias and prompt overfitting before adopting model changes.

EDUCATION

Georgia Institute of Technology, Atlanta, GA

Expected December 2027

Master of Science in Computer Science (Part Time)

Stony Brook University, Stony Brook, NY

December 2022

Bachelor of Science in Applied Mathematics and Statistics
