

Jaehoon Jung

hoon7589@gmail.com | (631) 838-1305 | [LinkedIn](#) | [GitHub](#) | [Portfolio](#)
Backend Software Engineer • U.S. Permanent Resident • Open to Relocation

SKILLS

Languages: Python, TypeScript/JavaScript, SQL

Backend: Django, Node.js, FastAPI, REST APIs

Frontend: Vue.js, React, Next.js

Databases: PostgreSQL, Oracle, MySQL

Cloud & DevOps: AWS, Google Cloud Platform, Docker, CI/CD, Linux, Git

EXPERIENCE

ComGen America, Software Engineer, Auburn, AL

February 2023 – Present

Web applications, ETL pipelines, and EDI for automotive OEMs and suppliers (Hyundai, Kia, Ford, GM, Tesla)

- Built and maintained end-to-end applications (Django and Node.js services and Vue/React) for inventory, production planning, ASNs, and shipping across five automotive partner environments.
- Redesigned a Python ETL pipeline processing X12 EDI from five automotive partners via AS2/SFTP; used execution plans to identify full-table scans, then added indexes and staged loads in temporary tables, reducing per-file processing time from ~20s to ~5s.
- Designed APIs and data workflows for order creation, part validation, label printing, ASN generation, and real-time dock monitoring, from plant requirements through UAT and release.
- Migrated a three-server production environment serving 2 plants from on-premises to AWS (EC2, VPC, Site-to-Site VPN), cutting estimated infrastructure cost ~40% and eliminating recurring connection-failure downtime through retry logic and automated recovery.
- Built a Codex-based coding agent grounded in legacy code, repository structure, and team conventions; adopted by 4 engineers across 3 projects to generate code consistent with existing architecture, improving long-term maintainability and reusability.
- Added structured logging, CloudWatch monitoring, and email alerting for errors and outages, letting engineers resolve incidents before end users reported them.
- Migrated legacy C#/ASP.NET and Java applications to TypeScript/Node.js and Django while preserving business rules and integration behavior; added CI build validation and led code reviews, UAT, and staged releases.
- Built reconciliation and task-assignment workflows for a company-wide operations app, reducing monthly corporate-card reconciliation from ~1 hour of manual work to ~30 seconds.

EDUCATION

Georgia Institute of Technology, Atlanta, GA

Expected December 2027

Master of Science in Computer Science (OMSCS)

Stony Brook University, Stony Brook, NY

December 2022

Bachelor of Science in Applied Mathematics and Statistics

PROJECTS

Picking Up | Full-stack task planner (Next.js, Django, PostgreSQL, Vercel, Cloud Run) | [Link](#)

- Designed transactional APIs for task nesting, rescheduling, and reordering using row-level locks and optimistic concurrency control, returning 409 Conflict on stale writes to keep multi-row updates atomic.
- Enforced case-insensitive uniqueness and hierarchy/scheduling CHECK constraints through staged migrations that backfilled existing data; verified with 190+ backend tests and a CI check rejecting uncommitted migrations.

Personal Finance Copilot (FastAPI, PostgreSQL, LLM Evaluation) | [Link](#)

- Built a FastAPI/PostgreSQL service to ingest and categorize bank and credit-card transactions across three institutions and four CSV formats, with idempotent imports, schema validation, and deterministic financial calculations separated from LLM outputs.
- Developed an offline LLM evaluation pipeline using development and merchant-separated holdout sets to detect category bias and prompt overfitting before adopting model changes.
