SKILLS

Languages: Python, TypeScript/JavaScript, SQL, C#, Java

Backend: Node.js, FastAPI, Django, ASP.NET, REST APIs, Java Spring

Frontend: Vue.js, React, Next.js, HTML, CSS

Databases: PostgreSQL, Oracle, MySQL

Integration: EDI (X12), AS2, SFTP, TCP socket

Cloud & DevOps: CI/CD, Linux, Windows Server, AWS, Google Cloud Platform, Docker, Git

EXPERIENCE

ComGen America, Software Engineer, Auburn, AL

February 2023 – Present

Logistics, scanning, and EDI/EAI systems for automotive OEM and supplier plants (Hyundai/Kia/Ford/GM)

- Owned full-stack logistics and manufacturing applications end to end, including requirements analysis, system design, API and UI development, testing, deployment, monitoring, and production support across Window Server, Linux, and cloud environments.
- Developed and optimized Python-based ETL pipelines that extracted X12 EDI documents received through AS2 or SFTP, validated and transformed partner-specific order and shipping data, and loaded it into Oracle using staging tables, indexing, and transactional batch inserts; reduced processing time from approximately 60% for a pipeline handling roughly 1,000 daily transactions.
- Built and maintained full-stack applications, REST APIs, and system integrations using C#/.NET, Java Spring, React, and Vue.js, supporting inventory, production planning, part validation, ASN generation, shipping, and real-time shop-floor workflows across five partner environments.
- Improved production reliability through structured logging, health checks, CI validation, and operational dashboards, enabling faster isolation of application, network, and partner-side failures.
- Migrated partner integrations from on-premises infrastructure to AWS using EC2, VPC, S3, IAM, CloudWatch, and Site-to-Site VPN, improving connectivity reliability and operational visibility.
- Modernized legacy C#/ASP.NET and Java applications with TypeScript/JavaScript, Vue, Node.js, and Django while preserving established business rules and integration behavior; coordinated code reviews, UAT, staged releases, and production troubleshooting.
- Developed and introduced a custom AI coding agent using codebase context, structured instructions, and legacy design patterns; applied it to a new project to generate architecture-consistent code, reduce implementation rework, and simplify ongoing maintenance for the team.
- Automated internal business workflows with a web application that categorized corporate-card transactions and generated reconciliation reports, reducing a monthly manual Excel process from approximately one hour to 10 seconds.

PROJECTS

Picking Up | Full-Stack Task and Routine Planner | [Link](#)

- Built and operated a production planner across Vercel and Google Cloud Run; API latency by over 90% (30+ seconds to under 3 seconds) by migrating its database from Oracle Autonomous Database to Neon PostgreSQL.
- Designed transactional APIs for task nesting, rescheduling, and reordering, using row-level locks and optimistic concurrency control to reject stale writes with 409 Conflict responses and keep multi-row updates atomic.
- Enforced case-insensitive uniqueness and hierarchy/scheduling CHECK constraints through staged migrations that backfilled existing data; verified behavior with 190+ backend tests and a GitHub Actions check that rejects uncommitted Django migrations.

Personal Finance Copilot | [Link](#)

- Built a FastAPI/PostgreSQL service to ingest and categorize bank and credit-card transactions across three institutions and four CSV formats, with idempotent imports, schema validation, and deterministic financial calculations separated from LLM outputs.
- Developed an offline LLM evaluation pipeline using development and merchant-separated holdout sets to detect category bias and prompt overfitting before adopting model changes.

EDUCATION

Georgia Institute of Technology, Atlanta, GA

Master of Science in Computer Science

Stony Brook University, Stony Brook, NY

Bachelor of Science in Applied Mathematics and Statistics
